

### ABSTRACT

A high refractive index layer of a cured first coating  
5 composition comprising (A) metal oxide fine particles  
selected from among titanium oxide, aluminum oxide, zirconium  
oxide, cerium oxide, iron oxide, tin oxide, and compound  
oxides thereof and (B) a compound having an acrylic,  
methacrylic, vinyl or styryl group, and a low refractive  
10 index layer of a cured second coating composition comprising  
(D) voided silica-base inorganic oxide fine particles and (C)  
a compound having at least two epoxy and/or oxetane groups  
are successively stacked on a substrate to form an  
antireflection film.
